Adherence Monitoring to Reduce Risk with Opioids
Deborah Mattellano, PhD, ANP, FNP, RN–BC
ANCC Certified in Pain Management

Objectives

- Present the legal and ethical requirements to perform adherence monitoring
- Present the range of opioid use and misuse patterns that increase risk
- Define how adherence monitoring standards known as risk assessment and risk stratification are used to reduce risk of opioid misuse throughout the continuum of care
- Explain how to integrate a practical approach for adherence monitoring into each patient interaction to reduce risk

Ethical Tenets

When opioid therapy is initiated, an ethical imperative is created to monitor the patient regarding risk for inappropriate use and response to treatment throughout the trajectory of care
**BACKGROUND**

**Iatrogenic opioid addiction**

**Aberrant drug related behaviors**

**Substance use disorders**

**Problematic opioid use**

**Ethical Tenets**

*Do No Harm*

Failure to treat pain is an unethical breach of human rights (Brennen, Carr, & Cousins, 2007)

Nurses are central to patient care for patients with pain and SUD

Declaration of Montreal, 2010, recognizes the intrinsic dignity of all persons, and that withholding of pain treatment is profoundly wrong, leading to unnecessary suffering which is harmful.

---

**Definitions**

Iatrogenic opioid addiction

Aberrant drug related behaviors

Substance use disorders

Problematic opioid use

---

**Problematic opioid abuse**

Criteria for problematic opioid use:

1. The patient displays an overwhelming focus on opiate issues during pain clinic visits that occupy a significant proportion of the pain clinic visit and impedes progress with other issues regarding the patient’s pain. This behavior must persist beyond the third clinic treatment session.

2. The patient has a pattern of early refills (three or more) or escalating drug use in the absence of an acute change in his or her medical condition.

3. The patient generates multiple telephone calls or visits to the administrative office to request more opiate, early refills or problems associated with the opiate prescription. A patient may qualify with less visits if he or she creates a disturbance with the office staff.

4. There is a pattern of prescription problems for a variety of reasons that may include lost medications, spilled medications or stolen medications.

5. The patient has supplemental sources of opiates obtained from multiple providers, emergency rooms or illegal sources.

Addiction

- Inability to consistently abstain
- Impairment in behavioral control
- Craving
- Diminished recognition of one's behaviors
- Dysfunctional emotional response

(ASAM, 2012)

Correction — Addiction is not an entirely predictable response to reward producing drugs, but may occur in biologically and psychologically susceptible individuals; it is diagnosed over time, based on established criteria.

Example 1: Addiction can accurately be predicted in patients and diagnosed at intake.

Therapeutic Tolerance
Psuedoaddiction
Misconceptions

Example 2: Substance misuse is the same as substance abuse, dependence, or addiction, and requires stopping all opioids.

Correction -- Many reasons for substance misuse:
- Varying cultural values
- Lack of education
- Misunderstandings
- Poor judgment
- These do not meet criteria for a substance use disorder.

Universal Precautions

Risk

Benefit

UNIVERSAL PRECAUTIONS

1. What is it?
   A 10 step systematic approach to the assessment & management of chronic pain patients
   - What does it offer?
     - A triage scheme for estimating the risk of SUD/addiction w/ chronic pain patients
   - Why is it needed?
     - Impossible to reliably determine who will develop SUD
     - Especially on initial encounter
   - What benefits result?
     - Systematic evaluations
     - Decreased provider fear and reactive responses
     - Early detection & Rx of aberrant behaviors

Example 2:
Substance misuse is the same as substance abuse, dependence, or addiction, and requires stopping all opioids.
Universal Precautions for Level of Risk

- Define pain diagnosis
- Informed consent
- Treat medication pre and post treatment
- Re-assessment of pain and level of function

Regular assessment of the Five A's
- Analgesia
- Activity
- Adverse effects
- Aberrant behavior
- Affect

Documentation

Barriers to identifying risk
- Stigma
- Misconceptions
- Limited access to providers familiar with identifying substance use disorders or other risks

Barriers
- Misunderstanding of indicators that could point to risk
- Lack of understanding of toxicology screening
- Lack of understanding of how to implement a systemized approach to adherence monitoring
Risk Prediction Instruments
SOAPP, ORT, COMM
PDUQ, ABC

Other assessments
Urine Drug Testing
Pill Counts, Prescription Drug Monitoring Programs

Order UDT with patient consent to answer a clinical question
Know what you are looking for
Seek guidance from experts at the laboratory

Understand limitations of UDT; design was never intended for use as screening test for chronic pain patients
Do not base clinical decisions solely on results from UDT

“Addiction is not simply a lot of drug use; it is a disease of the brain that is expressed through behavior”
Leshner, 1996

Identifying Problematic behavior

Continued use despite harm
Impaired control over use
Compulsive use
Craving
Examples of Risk Factors for Abuse of Pain Medications

- Family and personal history of substance abuse
- Cigarette dependency (particularly if smoking occurs first thing in the morning)
- History of preadolescent sex or sexual abuse
- Psychologic stress
- Patterns of impulsive behaviors
- Victimization by others in household such as an abusive spouse, physical abuse

Adapted from Webster and Webster (2005)

Examples of Risk Factors for Abuse of Pain Medications (cont.)

- History of repeated drug/alcohol rehabilitation
- Unwilling to try any other modality for pain relief
- Mental health disorder (particularly if unknown to the prescribing clinician)
- Young age
- Social patterns of drug use, or polysubstance abuse
- Failure to participate in drug or alcohol program for persons with substance use disorder
- Poor social support, chaotic lifestyle
- Unclear cause of pain, exaggeration of pain
- Declining functional status
- Large focus exclusively on opioids

Biopsychosocial-Spiritual Assessment
Biopsychosocial-spiritual Model (BPSS)

© Matteliano, Oliver, St. Marie, & Coggins 2012, adapted from Matteliano, 2010

Provide patient education regarding management of pain and side effects.

Informed consent (verbal or written/signed).

Psychologic assessment including risk of addictive disorders. The assessment of the patient uses the biopsychosocial model with the spiritual factors included.

Make a diagnosis with appropriate differential including the biopsychosocial-spiritual status.

The Ten Principles of Universal Precautions for Patients with Persistent Pain Using Chronic Opioid Therapy: A Biopsychosocial-Spiritual Approach

Pre and Post intervention assessment of pain level and function.

Appropriate trial of opiate therapy. Integrate cognitive therapy, and support groups.

This treatment agreement also includes safe storage of medications in the interest of public safety, e.g., Lock Your Meds, as well as rationale for potential opioid discontinuation or discharge from medication treatment.

Establish a therapeutic relationship promoting trust and honesty. Continue to review the Treatment agreement to establish expectations of both the provider and the patient.
Periodically review pain diagnosis and comorbid diagnoses, including addictive disorders and mental health.

Regularly assess the 5 A’s: Analgesia, Activity, Adverse reactions, Aberrant behavior, and Affect.*

Reassessment of pain level and function. Guided by the biopsychosocial-spiritual model, the assessment is included in its entirety. Adherence monitoring measures include urine toxicology, screening tools for alcohol/substance use disorders, pill counts, and overall adherence with treatment plan appointments and medication use.

*Adapted from “The Four A’s of Pain Treatment Outcomes” (Passik & Weinreb, 2000).

Adherence Monitoring Procedures

Educate, promote and sustain safe use of opioids

Establish risk category

Level of monitoring

Level of treatment

Low – medium – high

Consider how pain interacts with various physical, psychological, social, and spiritual issues over time.

Establish a therapeutic relationship between patient and provider as the foundation for all interventions and activities.

Conduct conversations in a respectful and direct manner while avoiding shaming statements.

Promote an honest exchange of information.

Provisions of age- and education-appropriate educational materials, feedback, support, and involvement of family members and others.

Foster responsible use and positive outcomes.

Central to the treatment plan is a shared decision-making process involving the patient, provider, and family, if appropriate.
Discuss and obtain an informed written treatment agreement. The treatment agreement provides information for expected behaviors of the prescriber and the patient. It also serves as an educational tool. This agreement should be reviewed periodically to clarify expectations.

Do not terminate the patient from your practice. Through clear boundaries of care and expectations, the patient may choose to leave your practice if they can not adhere to your care within the established guidelines. Terminating care unilaterally is not expected. With persistent nonadherence, weaning off opioids and referral to other forms of pain treatment are indicated.

Referral to addiction care may be necessary. Careful documentation to referral source reduces risk of perpetuating an abuse problem.

NEW PATIENT (PRE SCREEN) for Substance abuse/ Alcohol History, Quantitative Urine Drug Test (UDT). Continuing patient: need annual documentation of low risk strategies.

Ethical Obligations of Nurses
- evaluate and treat problems associated with unrelieved pain
- evaluate and treat problems associated with actual or potential risk of a substance use disorder or addiction
- advocate for holistic treatment of patients with pain and substance use disorders
- practice without stigmatizing patients
- correct misconceptions in practice
- advocate for holistic treatment of patients with pain and substance use disorders
It is not the type of disease that is important, but the person that has the disease.

Sir William Osler
